%define version    0.48
%define release    %mkrel 1

Name:       gnormalize
Summary: A ripper, an encoder and an audio converter
Version: %{version}
Release: %{release}
Group:      Sound
License: GPL
URL:      http://gnormalize.sourceforge.net
Source0: %{name}-%{version}.tar.bz2
BuildRoot:  %{_tmppath}/%{name}-%{version}-%{release}-root
BuildArch:  noarch
Requires:   normalize, cdparanoia
Requires:   vorbis-tools

%description
gnormalize is a front end to normalize, a ripper, an encoder and
an audio converter. It uses gtk2-perl.

gnormalize decodes the MP3/MPC/OGG/APE/FLAC file to WAV,
then normalizes the WAV to a targeted volume level and re-encodes it.
gnormalize can also rip, encode, convert audio format between MP3,
MPC, OGG, APE and FLAC, change the encoding and ID3 tag properties of
final normalized files.

%prep
%setup -q

%install
rm -rf $RPM_BUILD_ROOT

# We don't need to install Audio-CD*.tar.gz and CDDB_get*.tar.gz.
# Because mdk has the rpm packages: perl-CDDB_get, perl-Audio-CD.

# Install gnormalize
mkdir -p %{buildroot}%{_bindir}
   cp -vf gnormalize %{buildroot}%{_bindir}
